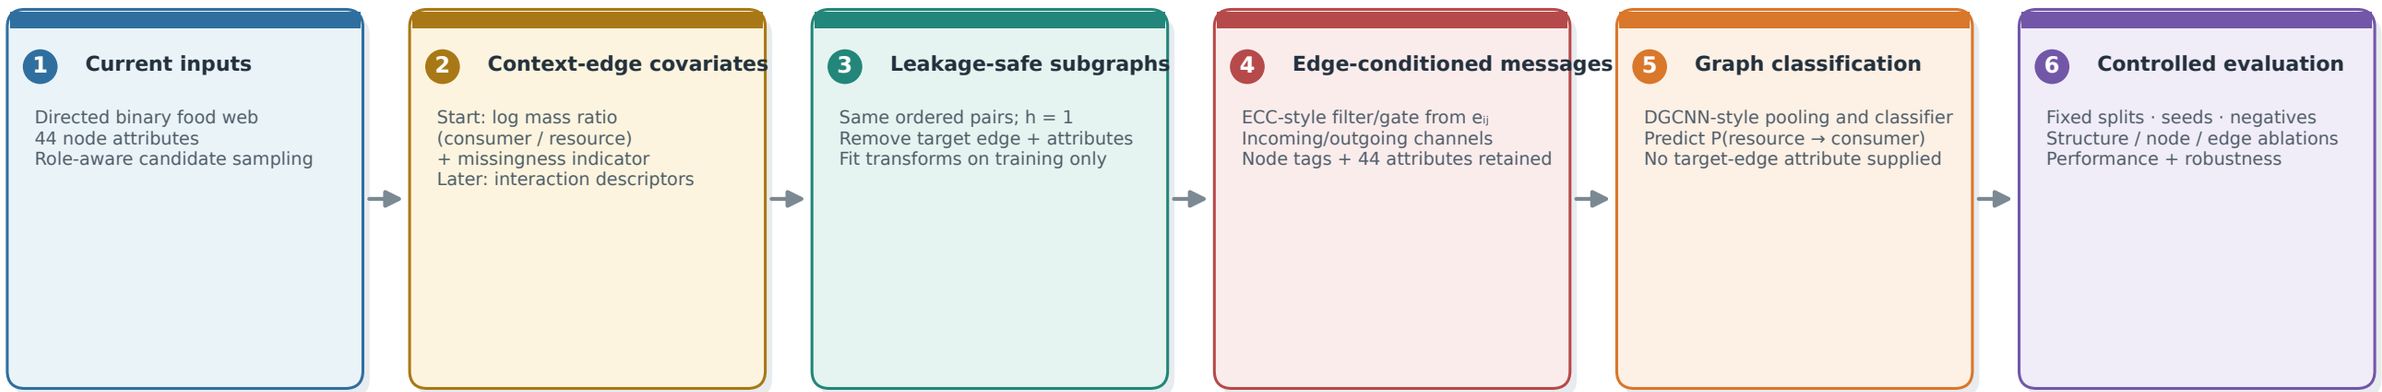
Edge-conditioned SEAL_directed | High-level proposal

PROPOSAL · NOT IMPLEMENTED

Add leakage-safe context-edge covariates while retaining the current node-attributed SEAL framework



SCIENTIFIC INTERPRETATION

The initial mass-ratio channel is a derived edge covariate—not measured interaction strength. It adds a relational inductive bias, but is partly redundant with node mass. True interaction weights can use the same architecture only when independently observed.

Primary methodological basis: Simonovsky & Komodakis, CVPR 2017 (ECC)
